Scan-Quality Checklist

A practical quality and safety check for NLS and bioresonance sessions

BEFORE THE SCAN

- ☐ Client identity and session purpose confirmed
- ☐ Informed consent and scope explained
- ☐ Recent symptoms or red flags reviewed
- ☐ Medical care, medication and procedures noted
- ☐ Sleep, food, hydration, stress and activity recorded
- ☐ Device, accessories and environment checked

DURING THE SCAN

- ☐ Client positioned comfortably and movement limited
- ☐ Unexpected findings repeated before interpretation
- ☐ Related views compared rather than relying on one marker
- ☐ Scan quality issues and interruptions documented
- ☐ Language remains observational, not diagnostic
- ☐ Session complexity matched to client readiness

BEFORE ACTING

- ☐ Finding connects with the client’s stated goal or context
- ☐ Pattern is repeatable and supported across relevant information
- ☐ Possible shared software source is recognised
- ☐ Contradictory or missing evidence is not ignored
- ☐ Priority is within practitioner scope
- ☐ Referral is considered when appropriate

AFTER THE SESSION

- ☐ Original priority reassessed first
- ☐ Client experience and observations recorded
- ☐ Changes and unchanged findings documented
- ☐ Next action chosen: continue, pause, change or refer
- ☐ Follow-up timing agreed
- ☐ Records stored securely and confidentially

Practitioner note: A technically clean scan can still be clinically irrelevant. Quality includes context, repeatability, ethical interpretation and knowing when not to act.
